

T-REX

ONE MILL FOR ALL

T-REX breaks through limits, regarding the lauter technology as well as the use of different raw materials

All currently used milling systems reveal several disadvantages: Steep conditioning mills cause high maintenance costs for ruffles. Dry roller mills result either in higher investment costs or a lower throughput. Hammer mills have a high electricity consumption and the installed engine power is huge. In addition, all these systems are tailor-made to treat only one or two different brewing grains. If more grains are used, further machines are necessary.

The grinder of the T-REX consists of several disks, which are lined up on two opposite shafts. The toothed arrangement of the disks forms a passage area which is enlarged by the factor of three compared to rolls of equal length. Due to the arrangement and structure of the disks, the grist is ground by shear stress, compressive stress as well as cutting stress. The more complex forces result in a very fast and energy-efficient milling of the grain. The grinding elements are equipped with an eccentric adjustment. This construc-

tion allows a precise adjustment of the milling gap by means of an electromotive drive.

Advantages:

- perfect grist quality
- unique flexibility concerning lauter technology and the use of raw materials
- compensation of current disadvantages
- exceeding previous performances regarding the raw material crushing
- simultaneously saving energy

The specific **electrical power consumption** of the T-REX is lower than the comparative values of roller and hammer mills. A common hammer mill has a specific energy demand of up to 9 kWh/t* of malt, whereas the value of the T-REX only amounts to approx. 4.5 kWh/t*. The efficient combination of drive speed and riffle makes the difference.

Due to the low energy consumption, the T-REX also produces **less noise** than, for example, a hammer mill. The statutory requirements regarding noise protection are met even without additional sound-absorbing devices. Hence, the **compact design** of the T-REX is maintained, which initially results from the efficient tothing of the grinding elements.

The disks of the T-REX have a very **long service life**. When using exclusively malt, a maintenance of the disks is required after a throughput of up to 35,000 t*. The disks can be individually replaced and can be corrugated up to three times. The replacement of the compact grinding elements is quickly and easily possible.

Yearly production costs

Filling: ~ 10 t / brew; 3.500 brews / year
electricity costs: 0,16 € / kWh

The compact design of the T-REX
